

IS THERE LIFE OUT THERE?

There are thousands of millions of galaxies in the universe. In our galaxy, the Milky Way, there are two hundred billion stars. In our solar system the planets spin around the sun. But scientists believe that there are millions of other planets in the universe. So far they have discovered sixty-three planets outside our solar system, but there are probably millions more. Could there be life on these planets? Scientists estimate that there may be one million planets on which, there is some form of intelligent life. Many people believe that they have seen life from other planets, extraterrestrials or Unidentified Flying Objects (UFO). Every year there are 14,600 reports about them! When might you expect to see a UFO or extraterrestrial? Most sightings take place between 180 and 90 minutes before midnight. So that's a good time to look out of your window!

QUESTIONS:

1. How many galaxies are there in the universe?
2. What is the name of our galaxy?
3. How many stars are there in our galaxy?
4. How many planets have been discovered outside our solar system?
5. By average, how many UFO sightings are there in a day?
6. Between what times do most sightings happen?
7. Do you think there is really life out there?
